# Ways of ventilation

Organisers:

International Co-owners:

## □ Ventilation rate procedure

a minimum quantity of cfm per person based on maximum occupancy, i.e. 30 cfm per person

## □ Indoor air quality (IAQ) procedure

vary outdoor air ventilation rate (from 0% to 100% of the design outdoor air) as long as the pollutant concentration remains below a recommended level

**Demand control ventilation**

# CO<sub>2</sub>-DCV strategy

Construction

# Control strategy with a typical VAV system

# DCV-CO2 strategy

## Existing problem of CO<sub>2</sub>-DCV

1. it cannot reflect the air volume requirement of building-generated indoor pollutants
2. it will result in energy waste that inaccuracy in design ventilation rate
3. all strategies are operated under the assumption that it's enough clean for outdoor air

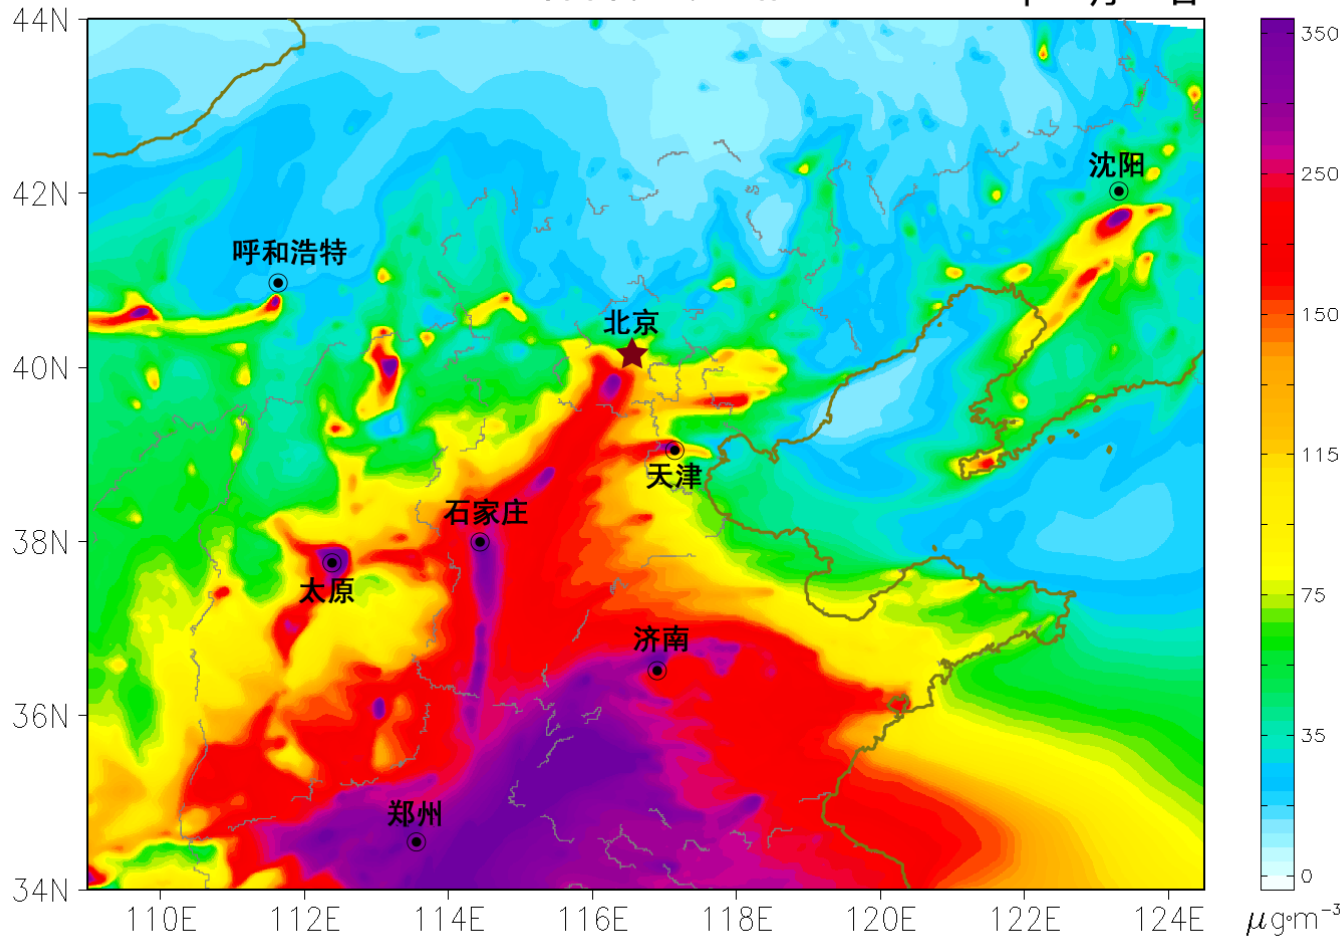

Table1. IAQ Control Indexes about Health

Parameter type	Number	Species	Reference value	Note
Chemical	1	SO <sub>2</sub> (mg/m <sup>3</sup> )	0.5	1h mean value
	2	NO <sub>2</sub> (mg/m <sup>3</sup> )	0.24	1h mean value
	3	CO(mg/m <sup>3</sup> )	10	1h mean value
	4	CO <sub>2</sub> (%)	0.1	Day mean value
	5	NH <sub>3</sub> (mg/m <sup>3</sup> )	0.2	1h mean value
	6	O <sub>3</sub> (mg/m <sup>3</sup> )	0.16	1h mean value
	7	HCHO(mg/m <sup>3</sup> )	0.1	1h mean value
	8	C <sub>6</sub> H <sub>6</sub> (mg/m <sup>3</sup> )	0.11	1h mean value
	9	C <sub>7</sub> H <sub>8</sub> (mg/m <sup>3</sup> )	0.2	1h mean value
	10	C <sub>8</sub> H <sub>10</sub> (mg/m <sup>3</sup> )	0.2	1h mean value
	11	B(a)P(mg/m <sup>3</sup> )	1	Day mean value
	12	PM10(mg/m <sup>3</sup> )	0.15	Day mean value
	13	TVOC(mg/m <sup>3</sup> )	0.6	8h mean value
Biological	14	Colonies number (cfu/m <sup>3</sup> )	2500	Instrument measurement
Radiological	15	Rn (Bq/m <sup>3</sup> )	400	Year mean value

# New strategy about DCV

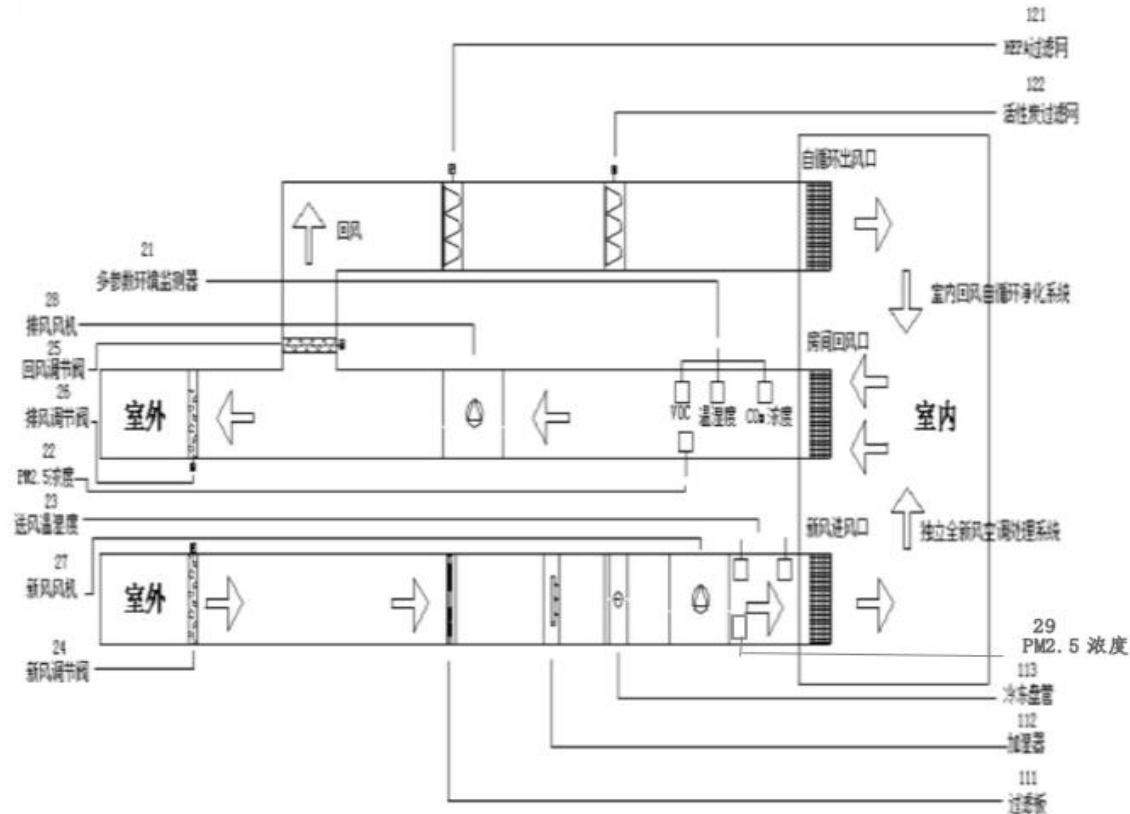

Organisers:

International Co-owners:

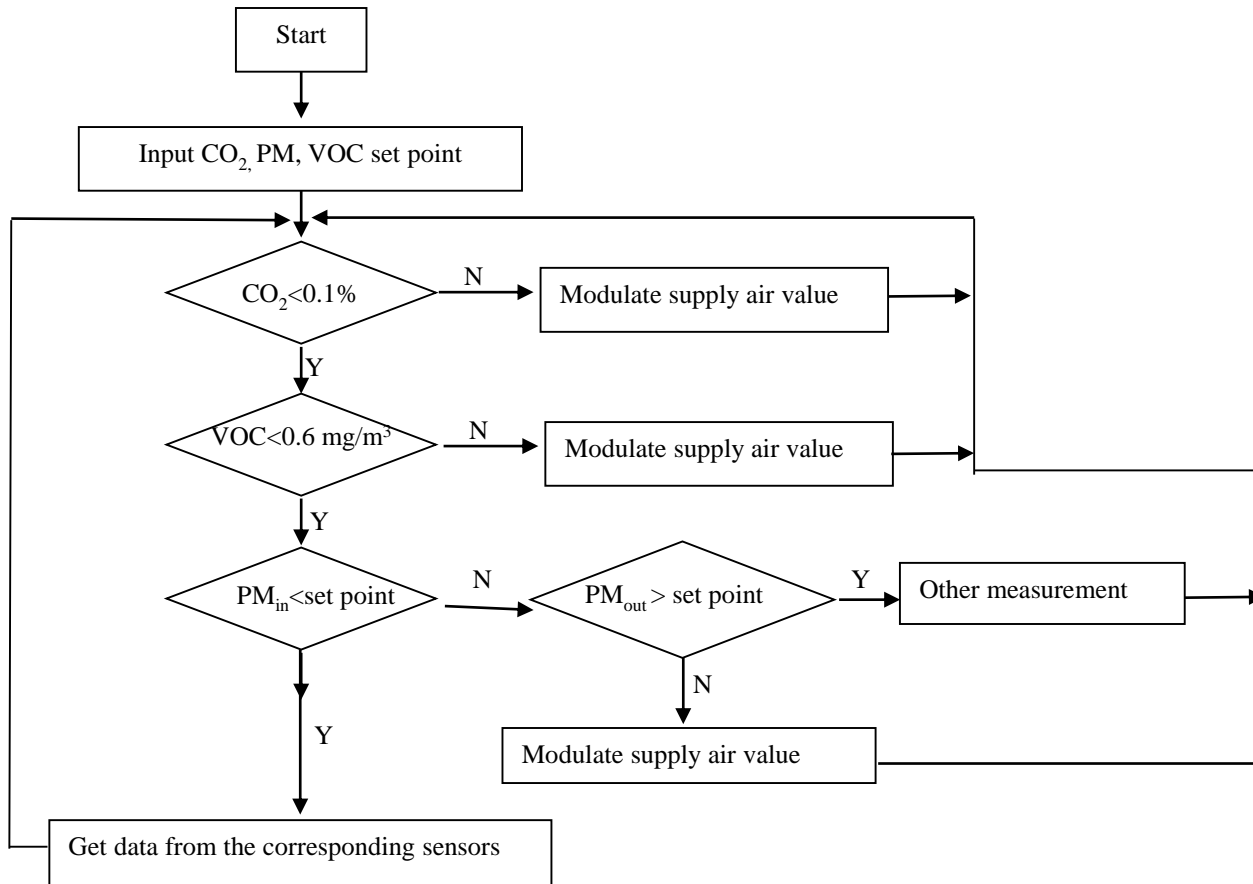

# Implication of strategy

Control index: indoor VOC concentration, indoor PM concentration, indoor CO2 concentration, indoor humiture, outdoor PM concentration and outdoor humiture.

# Control flow chart

## Summary

- ❑ The strategy presented above is based on the assumption that the data detected by **sensor is accurate and effective**. However, it's difficult to achieve higher precision with development of sensor technology at present. It is necessary to **develop a new type of sensor for measuring the concentration of VOC, PM and other pollutants**.
- ❑ **Single factor analysis** is made for various pollutants with the consideration that they don't effect each other. However, the various pollutants are mutually influenced in fact, and the impact on the human has not been analyze completely. The comprehensive index of air pollution needs to be further studied.
- ❑ The strategy are **based on the requirement of IAQ rather than energy saving**, so the set point of pollutants is need to be discussed.
